

Experiment no.8

Aim: Design and implement Registration form /Feedback form with database connectivity.

Theory

A **Registration/Feedback form** is a web-based interface that collects user data (like name, email, feedback, etc.) and stores it in a database for later retrieval and analysis.

Key components:

1. **Front-End (HTML/CSS/JavaScript)**
 - Provides the user interface for data entry.
 - Example: text boxes, radio buttons, dropdowns, submit button.
2. **Back-End (PHP/Java/Node.js/Python)**
 - Handles form submission.
 - Validates inputs and connects to the database.
3. **Database (MySQL/SQL Server/PostgreSQL)**
 - Stores user information securely.
 - Tables are designed with fields like id, name, email, feedback.
4. **Connectivity**
 - Achieved using database drivers (e.g., JDBC for Java, mysqli/PDO for PHP).
 - SQL queries (INSERT, SELECT) are used to store and retrieve data.

Program:

HTML file:

```
<!DOCTYPE html>
<html>
<head>
  <title>Registration Form</title>
</head>
<body>
  <form action="register.php" method="post">
    Name: <input type="text" name="name"><br>
    Email: <input type="email" name="email"><br>
    Feedback: <textarea name="feedback"></textarea><br>
    <input type="submit" value="Submit">
  </form>
</body>
</html>
```

Php Script:

```

<?php
$servername = "localhost";
$username = "root";
$password = "";
$dbname = "college_db";

// Create connection
$conn = new mysqli($servername, $username, $password, $dbname);

// Check connection
if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}

$name = $_POST['name'];
$email = $_POST['email'];
$feedback = $_POST['feedback'];

$sql = "INSERT INTO feedback_form (name, email, feedback)
VALUES ('$name', '$email', '$feedback')";

if ($conn->query($sql) === TRUE) {
    echo "Registration/Feedback submitted successfully!";
} else {
    echo "Error: " . $sql . "<br>" . $conn->error;
}

$conn->close();
?>

```

(MySQL) Database Table:

```

CREATE TABLE feedback_form (
    id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(100),
    email VARCHAR(100),
    feedback TEXT
);

```

Output:

Name:

Email:

Feedback:

Conclusion:

- A **Registration/Feedback form** integrates front-end design with back-end logic and database connectivity. This implementation demonstrates the **core principles of web programming**: user interaction, server-side processing, and persistent storage.
